**Providing Complete  
Power Transmission Solutions  
For Over 100 Years**

# Oil Field Roller Chains

Roller Chains installed in oil field applications are subjected to particularly severe operating conditions. Reliability and durability must therefore be assured.

Meticulous quality control, special manufacturing processes and the selection of the most suitable materials provide the optimum combination of fatigue and wear resistance for Link-Belt oil field roller chains. These means ensure the best performance in this specialized area of roller chain application.

### OF – Mark of Link-Belt Quality

Link-Belt oil field roller chains bear the trade mark "OF" as a symbol of their special suitability for use in oil-drilling operations. The trade mark stands for high precision, absolute dependability and long life. It is your assurance of excellent products from a leading modern chain manufacturer.

## The parts of the Roller Chain

## Performance, that Persuades

Over the past 100 years the brand name Link-Belt has become synonymous with top-quality chain products. In addition, Link-Belt roller chains are manufactured under DIN EN ISO 9001 certification.

### Approved Certificate

Link-Belt is authorized to use the official API monogram on oil field chains and sprockets manufactured in accordance to API Spec. 7 F.

All Link-Belt products are manufactured under DIN EN ISO 9001 certification.

# Link-Belt Quality Features

## High Through Hardness

In through hardening processes, the material is hardened through its entire cross-section. Through hardening is specified to increase strength, improve fatigue resistance and reliability. Link belt chain sideplates, rollers and pins are through hardened.

## Ball Drifting

Ball drifting of the plate bores serves to achieve strain-hardening of the material. All punching flutes and sharp edges are simultaneously removed. Press fits and fatigue strength are so optimally improved.

## Shot Peening

All chain parts are shot peened for further improving fatigue resistance. This effective cold processing moreover consolidates the surfaces and increases their load-bearing properties. Such parts have a built-in tension and therefore higher resistance against loading.

## Shock Resistant Rollers

Link-Belt rollers are produced to high precision, of a uniform wall thickness and absolutely free from any taper. An optimal seating and smooth running is so warranted. The rollers are shot-peened and possess a high fatigue strength for resisting running-in impacts.

## Pre-Loading

Link-Belt roller chains are "pre-run-in" under high load. Customary chain run-in elongation is thereby minimized and expensive tensioning in application avoided. All chains are subjected to a severe length control. High pre-loading enhances their load-bearing property and reliability.

## Lubrication

The chains will be Ex-work lubricated with a hot-dip lubricant with outstanding corrosion and maximum shelf life.

## Quality is our standard

## Uniform Quality

The uniform quality of Link-Belt chains is not merely ensured by initial and final inspections, but far more, also by in-process routine testing of the individual elements.

## Chain Ordering Information

### RC 80 SU FR EW

**(SU) Super Ultimate:**  
SU series chains differ from standard roller chains in increased sidebar thickness, through hardened pin material and heat treatment. The result: greater average ultimate tensile strength ratings. Capable of withstanding higher operating and intermittent shock loading without reduction of pin bushing wear life.

**(FR) Fatigue Resistant:**  
FR series chains incorporate a series of cold working operations with advanced heat-treating processes resulting in added strength and longer service life for sidebars, pins, rollers and bushings.

**(EW) Shepherd's Crook Cotter:**  
EW designates those chains equipped with the exclusive Link-Belt Shepherd's Crook Cotter. Uniquely engineered to stay firmly in place with increased shear strength over standard non-heat-treated-cotters.
